SERAG
WIESSNER

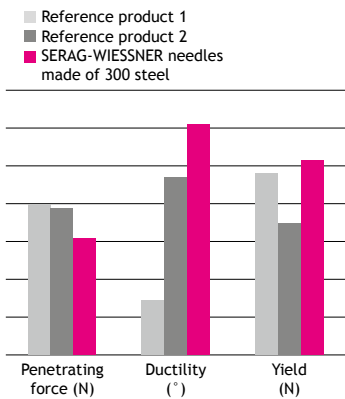

Convincing down to the smallest detail

Decades of experience

Hi-tech and hand-crafted

For nearly 150 years, SERAG-WIESSNER has stood for surgical sutures of the highest quality. As the oldest established German manufacturer, the company combines decades of tradition with state-of-the-art technology. Extremely precise automated production technology is combined with the reliable and diligent work of our experienced employees. In addition, we work closely together with medical professionals in both clinical practice and research.

This results in an extensive range of top-quality suture materials for dental and maxillofacial surgery.

● Round-bodied needle, with standard point

⊕ Round-bodied needle, with trocar point

SERAG-WIESSNER 300 STEEL NEEDLES HAVE VERY HIGH DUCTILITY AND LOW PENETRATING FORCES.

Needles

We offer a wide range of atraumatic needles for dental and maxillofacial surgery. They are stainless steel needles with high resistance to bending and exceptional penetrating qualities which allow the surgeon to work easily and safely.

The designation of our atraumatic needles uses a combination of letters and numbers as recommended by the Technical Committee of the Association

of Surgical Suture Manufacturers. The first two letters denote the needle shape and cross-section. A third or even fourth letter indicates special characteristics of the needle. The number following the letters gives the needle length (true length when straightened out).

▼ Reverse cutting needle

▼ Reverse cutting needle with special point

Needles

Needle shape

D = $\frac{3}{8}$ circle

G = straight

H = $\frac{1}{2}$ circle

Needle cross-section

R = round-bodied

S = reverse cutting

Special characteristics

S = slim point

T = trocar point

Examples:

DS 18 D $\frac{3}{8}$ circle
 S reverse cutting
 18 18 mm long
 (straightened length)

HRT 20 H $\frac{1}{2}$ circle
 R round-bodied
 T trocar point
 20 20 mm long
 (straightened length)

Suture material

Non-absorbable sutures

1) SUPRAMID (black and undyed)

With smaller diameters of 5-0 to 7-0, the non-absorbable polyamide thread is a monofilament. At sizes larger than 4-0, SUPRAMID consists of twisted fibres that are coated and therefore have a pseudo-monofilament character. SUPRAMID provides exceptional knot security and, because of its lack of capillarity (analogous to monofilaments), it is greatly valued in dental and maxillofacial surgery.

2) SERAFLEX® (black and undyed)

The raw material used for SERAFLEX® is the fine thread from silkworm cocoons. The raw silk threads are specially braided and coated to make them water-repellent and resistant to serous secretions. Silk is a non-absorbable suture material

of natural origin which has been used effectively in surgical procedures for centuries. Its superior handling and pliability are particularly impressive.

3) TERYLENE (green and undyed)

This braided polyester thread is coated and consists of non-absorbable material. TERYLENE has proved its worth in various fields over the past decades. Its high tensile strength is a particularly positive characteristic.

4) SULENE® (green)

The non-absorbable SULENE® thread consists of specially braided polyester. A special coating prevents it cutting through the tissues (as may happen with braided sutures) and reduces capillarity to a minimum.

5) SERALON® (blue and undyed)

This non-absorbable polyamide thread is extremely soft and pliable compared with other monofilament sutures. In addition, SERALON® has the necessary tie-down performance for knot security. Its superior handling characteristics mean that it has proven its worth for skin sutures over many years.

6) SERAPREN® (blue)

This is a non-absorbable monofilament polypropylene thread. Its smooth pore-free surface means that SERAPREN® is also recommended for skin sutures.

7) SERALENE® (blue)

Thanks to its smooth pore-free surface, this non-absorbable monofilament polyvinylidene fluoride (PVDF) thread passes optimally through the tissues. PVDF is a substance related to polytetrafluoroethylene (PTFE).

8) SERAMON®

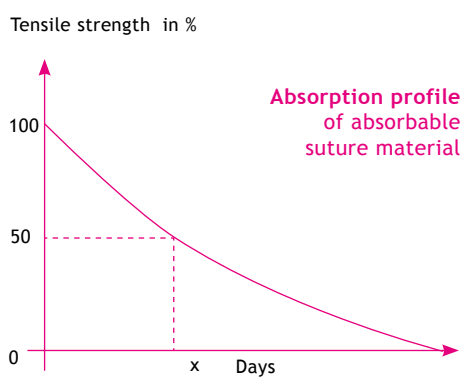

SERAMON® is a reliable accessory for surgical procedures, in which safety and patient comfort count. This monofilament PTFE suture is highly flexible and has an extremely high tensile strength, is permanently inert, monofilament, well tolerated by and able to pass readily through tissues and can be knotted with ease. All these positive features are thanks to the special consistency of the suture material. As it is extremely soft, this thread is particularly well tolerated by patients when used for mucous membranes.

9) SERATAN®

SERATAN® is a new type of suture based on plasma technology, in which monofilament polyamide threads are very finely coated with titanium. As a result, these sutures are extremely well tolerated in the body, which is decisive in determining the healing process.

Absorbable sutures

x = half-life
Time when the tensile strength reaches 50% of its original value.

Absorption time
Time until the thread is completely absorbed.

Absorption of synthetic suture materials

Material	Half-life (days)	Absorption time (days)
SERAPID®	approx. 6-8	approx. 30-42
SERAFIT®	approx. 15-20	approx. 60-90
SERAFAST®	approx. 8-13	approx. 90-120

Absorbable sutures

8) SERAFIT® (violet and undyed)

This braided polyglycolic acid thread, which is absorbable in the medium term, is particularly distinguished by its excellent pliability, its ability to pass smoothly and readily through the tissue during suture placement as well as by its minimum sawing effect. It can be tied reliably, especially in areas containing a good deal of blood or tissue secretions, and ensures knot security.

9) SERAPID® (undyed)

Just like our SERAFIT® sutures, this thread has an optimal pliable braided structure and a high knot tensile strength. It particularly excels in its rapid absorption time, which is achieved thanks to a shortening of the molecular chain of the base polymer.

10) SERAFAST® (violet and undyed)

SERAFAST® is the right choice for indications with a short wound healing phase, when all the advantages of monofilament sutures count. It consists of polyglycolic acid-caprolactone and is characterised by its most welcome softness.

Cassette packs

The reels of suture material, which have been used for many years, hold up to 100 metres of thread. Sterility of the thread can be guaranteed right to the end of the cassette with correct handling, by carefully removing the required length in accordance with the instructions for use. Winding the thread on a reel keeps the thread smooth and easy to handle.

This packaging is registered as a medical device for human use on the basis of a conformity assessment procedure, as confirmed by the **CE** marking.

Recent modifications made in our packaging development department have improved the packaging even further. Our efforts have gained an award from the German packaging industry.

iQ box

The iQ box was developed as a multi-functional thread carrier, suitable for absorbable and non-absorbable suture materials as well as for both braided (multifilament) and monofilament threads.

In the iQ box, the needle and thread can be identified immediately and removed without difficulty. This pack considerably reduces the memory effect.

The German packaging industry recognised our efforts with a “best packaging” award.

iQ box/ Cassette packs
